GPA, above 54 of the 61 other email verification and deliverability tools we grade

OnDMARC is Red Sift's cloud application for setting up and managing DMARC, SPF and DKIM for the services that send email for a domain. Records are edited inside the app rather than in DNS. Plans range from a small-organization tier to enterprise packages, sized by sender domains, email volume and data history.

Keep it, or make your own?

Whether this is something you could build for yourself with an AI app builder, and what you would give up.

Keep it

The plain part of Red Sift OnDMARC you could make: reports. What surrounds it you could not. The 4 things listed below take a company, not a weekend.

It is one of the better ones too: its GPA of 2.6 is higher than 54 of the 61 other email verification and deliverability tools we grade. It costs $108 a year.

What you could make

- Reports: an app builder makes this well.

What you could not

- Reading the reports inbox providers send about your domain.

- It plugs into other products, Slack among them, and has an API.
- What a company asks for before it lets staff use something: single sign-on and roles and permissions.
- The depth: we grade its features B, which means it covers the whole job.

What this rests on. Red Sift OnDMARC's listing: what it does, where it runs, what it plugs into and what it costs. It is a judgement about the kind of software this is. We have not built a replacement for it, and making your own means looking after it too. How we decide, and every tool's verdict.
